# Marg Analytics — Sales Dashboard

Excel Dashboard | Portfolio Business Analysis

## Business Insights & Recommendations

## Executive Summary

Marg Analytics reviews 2,000 sales orders using Microsoft Excel, Pivot Tables, Pivot Charts, and an interactive dashboard. The project reports total revenue of approximately **2.45 million** (currency not specified), **5,552 units sold**, and an **average order value of 1,226.04**. The dashboard focuses on category performance, sales channels, customer type, product concentration, regional contribution, monthly trends, and salesperson performance.

The strongest reported patterns are the concentration of revenue in Computers, Online sales leading among channels, and returning customers contributing a majority of revenue. These findings suggest that inventory planning, channel optimization, and customer retention are useful decision areas. Because the currency and underlying workbook values are not specified in the repository summary, this report retains the stated units and avoids adding unsupported financial assumptions.

## KPI Snapshot

| KPI | Reported value | Interpretation |
|---|---|---|
| Total orders | 2,000 | Order volume represented in the analysis |
| Total revenue | 2.45 million | Reported sales value; currency not specified |
| Units sold | 5,552 | Total quantity sold |
| Average order value | 1,226.04 | Average sales value per order, as defined by the project |

## Business Insights

### 1. Computers are the leading revenue category

Computers contribute approximately **54.9% of total revenue**, indicating a material concentration in this category. This can guide procurement and product availability, but high revenue share alone does not establish high profitability. Review gross margin, inventory turnover, supplier lead times, and stock-out frequency before increasing allocation.

### 2. Online is the highest-revenue sales channel

Online is reported as the top channel, followed by Corporate Sales and Retail Stores. This suggests online is an important revenue engine. Compare channel performance using order count, average order value, margin, discount rate, fulfilment cost, and conversion rate. Channel investment should be based on contribution profit rather than revenue ranking alone.

### 3. Returning customers contribute approximately 68.7% of revenue

Returning customers account for a reported 68.7% of revenue. This indicates that repeat purchasers are commercially important and customer retention should be measured deliberately. Monitor repeat-purchase rate, purchase frequency, time between purchases, and revenue per returning customer. The percentage describes revenue contribution, not the percentage of customers who return.

### 4. Revenue is concentrated among a small set of products

The five highest-revenue products contribute approximately **57.7% of total revenue**. This concentration makes availability of leading products important, while also creating exposure if a key item becomes unavailable or demand changes. Track product-level margin and stock cover, and assess whether complementary products can diversify the revenue mix.

### 5. North and Central are leading regions

North and Central are identified as the two leading regions by revenue, with closely matched results. Treat these regions as priority candidates for deeper analysis rather than assuming one is definitively stronger. Compare order volume, average order value, category mix, channel mix, sales coverage, and profit contribution by region.

### 6. Monthly revenue varies considerably

The dashboard reports meaningful variation in revenue across months. Monthly monitoring can support sales targets, campaign timing, staffing, and inventory planning. Check whether patterns repeat across multiple years and distinguish seasonal effects from one-off promotions, changes in product availability, or incomplete periods.

### 7. Salesperson performance should be evaluated with context

The project includes salesperson performance analysis. Rankings are most useful when adjusted for territory, customer portfolio, product mix, lead allocation, and sales targets. Review revenue alongside margin, order count, new-customer acquisition, repeat sales, and target attainment to avoid rewarding high revenue that may depend on heavy discounting.

## Recommended Actions

- **Protect availability of leading products:** Use category and product-level demand to set replenishment thresholds, then validate decisions with margin, stock cover, and supplier lead time.
- **Optimize online channel economics:** Track conversion, average order value, discounting, fulfilment cost, returns, and contribution margin alongside revenue.
- **Strengthen repeat-customer programs:** Segment returning customers by recency, frequency, and monetary value; test targeted offers and measure incremental repeat purchases.
- **Manage concentration risk:** Review dependence on the top five products and identify complementary products or categories that can broaden revenue contribution.
- **Compare regions fairly:** Analyze regional revenue and profit with order volume, channel mix, product mix, and sales coverage.
- **Plan around verified monthly trends:** Set targets and inventory plans using repeatable patterns, not a single month’s spike.
- **Use balanced salesperson scorecards:** Combine revenue with margin, target attainment, customer retention, and new-business development.

## Data Quality and Reporting Controls

- **Currency definition:** The repository states that the source workbook does not specify a currency. Label revenue and average order value with the correct currency before external or portfolio presentation.
- **Future-dated records:** The repository indicates records through December 2026. Since the current date is October 28, 2026, validate any November–December 2026 records before presenting them as completed actual sales.
- **Reconcile dashboard totals:** Recalculate order count, revenue, units sold, and average order value from the full source data, then compare results with Pivot Tables and dashboard cards.
- **Verify order uniqueness:** Confirm that the 2,000 Order IDs are unique and that data joins do not duplicate orders or revenue.
- **Check KPI definitions:** Confirm whether average order value is total revenue divided by order count and document the treatment of discounts, returns, cancelled orders, and taxes.
- **Use comparable periods:** Ensure monthly and regional comparisons use consistent date filters and exclude incomplete periods where appropriate.
- **Add profitability measures:** Revenue alone cannot establish business value. Add gross profit, margin percentage, discount rate, and fulfilment cost if the source data supports them.

## Conclusion

Marg Analytics provides a useful Excel-based sales reporting foundation, with 2,000 orders, approximately 2.45 million in reported revenue, 5,552 units sold, and an average order value of 1,226.04. The stated insights point to three priorities: manage the concentration in Computers and top products, improve online channel economics, and sustain repeat-customer revenue. Before using the results for business decisions, validate currency, future-dated records, and dashboard-to-source reconciliation.
